

$$V_{av} = \frac{\text{Total distance}}{\text{Total Time}} = \frac{S}{t}$$

$$1 \text{ min} = 60 \text{ sec}$$

$$5 = 5$$

$$\frac{5}{5} = 1$$

$$\frac{1 \text{ min}}{60 \text{ sec}} = 1$$

GRAPHS OF MOTION 1

1. A racer covered a 4500 m course in 18 minutes. Calculate the velocity in meters per second.

$$V = \frac{S}{t} = \frac{4500 \text{ m}}{18 \text{ min}} \times \frac{1 \text{ min}}{60 \text{ sec}} = \frac{4500 \text{ m}}{1080 \text{ s}} = 4.17 \frac{\text{m}}{\text{s}}$$

2. Jane ran at a constant speed of 2.75 m/s for 30 minutes. How far did she run in meters? Km?

$$V = \frac{S}{t} \text{ so } S = Vt = (2.75 \text{ m/s})(1800 \text{ s}) = 4950 \text{ m}$$

$$= 4.95 \text{ km}$$

3. A photon of light travels at $3 \times 10^8 \text{ m/s}$ (the speed limit of the universe). If it takes light about 9 minutes to reach Earth from the sun, what is the Earth-Sun distance?

$$S = Vt = (3 \times 10^8 \text{ m/s})(5400 \text{ s}) = 1.62 \times 10^8 \text{ m}$$

4. Does this graph of a trip by a car represent a real situation? Explain.

NO
Cannot go back in Time.

5. A car drives on a road at a speed of 35 mph. Convert this into m/s and compare the distance the car travels in one second to the size of our classroom.

$$35 \frac{\text{miles}}{\text{hr}} \times \frac{1 \text{ m/s}}{2.237 \frac{\text{miles}}{\text{hr}}} = 15.65 \frac{\text{m}}{\text{s}}$$

6. Calculate the slope of the following graphs. Be sure to state units.

$$\text{Slope} = \frac{\text{rise}}{\text{run}} = \frac{200 \text{ km}}{5 \text{ hr}} = 40 \text{ km/hr}$$

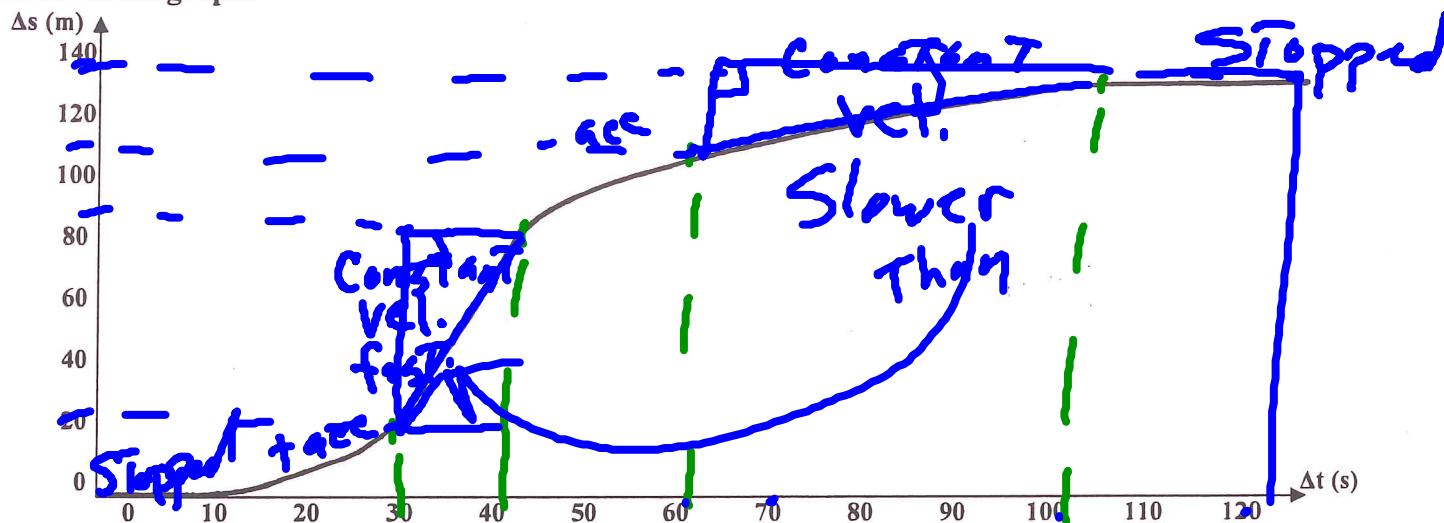

$$\text{Slope} = \frac{\text{rise}}{\text{run}} = \frac{5 \text{ m}}{2 \text{ s}} = 2.5 \text{ m/s}$$

$$\text{Slope} = \frac{\text{rise}}{\text{run}} = \frac{-40 \text{ kg}}{5 \text{ wks}} = -8 \text{ kg/wk}$$

7. Refer to the graph.

a. Describe the "trip".

Note graph

b. At what time is the person going the fastest? Calculate this speed.

30-40s Slope - Speed - $\frac{85-20}{40-30} = \frac{65}{10} = 6.5 \text{ m/s}$

c. How fast is the person going at time 70 seconds?

Slope - $\frac{138-110}{100-60} = \frac{28}{40} = \frac{14}{20} = 0.7 \text{ m/s}$

d. What is the average speed for the entire trip?

$\frac{S}{T} = V_{av} = \frac{140 \text{ m}}{120 \text{ s}} = \frac{7}{6} \text{ m/s} = 1.16 \text{ m/s}$

8. A train travels 100 km/hr for 0.52 hr, then 50 km/hr for the next 0.24 hr and finally 125 km/hr for the last 0.65 hr. What is the average speed of the train for this trip?

"Well, finally! I thought this thing would never end."

$V_{av} = \frac{S}{T} = \frac{145.25 \text{ km}}{1.41 \text{ hrs}} = 103 \text{ km/hr}$
