

FUTURE NORTH STARS CAUSED BY WOBBLE OF THE EARTH (PRESSION)

Earth's precessional cycle about 26,000 years
(or 1 degree every 72 years)

Next north star ALrai (or Errai 4000 AD) THEN ALFIRK
(5500 AD) THEN ALderamin (7500 AD) Deneb (10000 AD).
VEGA (14000 AD); Thuban

The 26,000-year precession cycle causes the north celestial pole to move counter-clockwise in front of the backdrop stars at about one degree every 72 years!
